

Feasibility Study

1) Review and Assignment

- ✓ Reconsideration of the preliminary report
- ✓ Analysts must schedule users, management, computer services staff, outside vendors or suppliers, and themselves into specific times.
- ✓ Most analysts use a Gantt chart for scheduling activities. These schedules serve two purposes :
 - ✓ they indicate to management whether the time allotted for the project is reasonable
 - ✓ they guide the analysts in performing their tasks efficiently, thus providing a measure of control over the project

2) Fact Finding

- ✓ Learning as much as possible about the present system
- ✓ Interview, questionnaires, observes the current system, gather forms and documents currently in use
- ✓ Determines the flow of data through the system, and clearly defines the system requirement
- ✓ Questionnaires

3) The Feasibility Study

- ✓ Describe the current system in narrative form, with context diagram and data-flow diagram, or with the system flowchart
- ✓ Alternatives, Costs, and Benefits
 - ✓ Do nothing, leaving the existing system alone.
 - ✓ Hire more staff, partially automate the system, but continue with essentially a manual system.
 - ✓ Purchase software from an outside software supplier
 - ✓ Design, program and install a customized system

4) Presentation of Findings to Management

- ✓ Never read the feasibility study aloud; instead, summarize it, while trying to lead the audience to support the study's recommendations.
- ✓ Use visual aids, such as chalkboards, flipcharts, slides, photographs, and overhead transparencies.
- ✓ If appropriate, demonstrate equipment or software to show how it will work.
