

## Development

- ✓ Develop Components and Code Application
  - ✓ Implement Connection Points between Components
  - ✓ Produce Manuals, User and Technical Documentation
  - ✓ Develop Test Plans
  - ✓ Deliver Beta Version of Application
- 
- Ensure that the code follows established standards of style, structure, and documentation. Even though languages like C let you be super-compact and hence super-obscure in your coding, don't forget that a human being (maybe even you) may have to work with that code again some day. Clarity of code is usually preferred over conciseness.
  - Ensure that the code is being properly tested and integrated, and that revisions made in coded modules are properly identified.
  - See that code writing is following the stated schedule. It probably won't be; the customer is entitled to know this and to know the impact on delivery time.
  - Ensure that code reviews are being held as scheduled.
